

S.B. JAIN INSTITUTE OF TECHNOLOGY MANAGEMENT & RESEARCH, NAGPUR

Practical 03

Aim: Automate student marksheet generation, system information display, Fibonacci and prime number generation, and file management operations using shell scripts to enhance computational efficiency and user interaction.

Name: Darshak K. Bisane

USN: CM25D004

Semester / Year: IV/II

Academic Session: 2025-26

Date of Performance:

Date of Submission:

❖ **Aim:** Automate student marksheet generation, system information display, Fibonacci and prime number generation, and file management operations using shell scripts to enhance computational efficiency and user interaction.

❖ **Tasks to be done in this Practical.**

- a) Write a shell script to generate mark- sheet of a student. Take 3 subjects, calculate and display total marks, percentage and Class obtained by the student.
- b) Write a menu driven shell script which will print the following menu and execute the given task.
 - Display calendar of current month.
 - Display today's date and time.
 - Display usernames those are currently logged in the system.
 - Display your terminal number
- c) Write a shell script which will generate first n Fibonacci numbers like: 1, 1, 2, 3, 5, 13
- d) Write a shell script which will accept a number b and display first n prime numbers as output.
- e) Write menu driven program for file handling activity
 - Creation of file.
 - Write content in the file.
 - Upend file content.
 - Delete file content

❖ **Objectives:**

1. Automate marksheet generation with total, percentage, and class classification.
2. Develop menu-driven scripts for system information and file operations.
3. Generate Fibonacci and prime numbers for user-defined inputs.

❖ **Requirements:**

✓ **Hardware Requirements:**

- Processor: Minimum 1 GHz
- RAM: 512 MB or higher
- Storage: 100 MB free space

✓ **Software Requirements:**

- Operating System: Linux/Unix-based
- Shell: Bash 4.0 or higher
- Text Editor: Nano, Vim, or any preferred editor

❖ Theory:

Shell scripting is a powerful way to automate repetitive tasks and manage system operations efficiently. It allows users to write programs using shell commands and scripting constructs. Shell scripts are interpreted line-by-line by a shell interpreter, making them ideal for administrative tasks, file management, and system automation. This practical encompasses a variety of real-world scenarios that demonstrate the utility of shell scripting for computing tasks and resource management.

1. Marksheet Generation

This script takes input marks for three subjects, calculates the total marks, percentage, and determines the class of the student based on predefined conditions. Conditional statements (if-else) are used to classify the performance into distinction, first class, second class, or fail. This exercise emphasizes the use of arithmetic operations and decision-making constructs.

Key concepts include:

- Reading user input using read
- Arithmetic operations with `$((expression))`
- Conditional statements for decision-making

2. Menu-Driven Script for System Information

Menu-driven scripts enhance user interaction by presenting a list of options for performing different tasks. In this practical, options are provided to display the calendar of the current month, the current date and time, logged-in users, and the terminal number. The script utilizes looping constructs (while) and case statements for structured flow control.

Commands used:

- cal for displaying the calendar
- date for showing current date and time
- who to list logged-in users
- tty to identify the terminal

3. Fibonacci Number Generation

Fibonacci numbers are a sequence where each term is the sum of the two preceding ones. The script uses iterative constructs (for loop) to generate n terms based on user input. This practical illustrates the use of loop control and variable swapping to generate series data efficiently.

4. Prime Number Display

This script accepts an integer n and outputs the first n prime numbers. A nested loop checks divisibility to determine if a number is prime. The practical demonstrates logic building for number-theoretic operations using loops and conditionals.

5. Menu-Driven File Management

The file handling script enables users to create, write, append, and delete file content. The case construct manages different file operations.

Commands include:

- touch to create files
- cat for writing and appending content
- rm for deleting files

This exercise emphasizes text manipulation, input handling, and file control mechanisms in Unix-like environments.

Diagrammatical View of Shell

❖ CODES

1. Write a shell script to generate mark- sheet of a student. Take 3 subjects, calculate and display total marks, percentage and Class obtained by the student.

Output 1:

```
~/DarshakBisane$ nano que_1.sh
~/DarshakBisane$ chmod +x que_1.sh
~/DarshakBisane$ ./que_1.sh
Enter Student Name:
Darshak Bisane
Enter marks for Subject 1:
98
Enter marks for Subject 2:
99
Enter marks for Subject 3:
98
-----
MARK SHEET
-----
Student Name : Darshak Bisane
Total Marks : 295
Percentage : 98 %
Class : First Class
-----
~/DarshakBisane$
```

2. Write a menu driven shell script which will print the following menu and execute the given task.
 - Display calendar of current month.
 - Display today's date and time.
 - Display usernames those are currently logged in the system.
 - Display your terminal number

Output 2:

```
1. Display calendar of current month
2. Display today's date and time
3. Display usernames currently logged in
4. Display your terminal number
-----
Enter your choice:
3
Users currently logged in:
~/DarshakBisane$ 2
bash: 2: command not found
~/DarshakBisane$ ./que_2.sh
-----
MENU
-----
1. Display calendar of current month
2. Display today's date and time
3. Display usernames currently logged in
4. Display your terminal number
-----
Enter your choice:
2
Today's date and time:
Tue Jan 27 17:01:45 UTC 2026
~/DarshakBisane$
```

3. Write a shell script which will generate first n Fibonacci numbers like:
1, 1, 2, 3, 5, 13

Output 3:

```
~/DarshakBisane$ nano Que_3.sh
~/DarshakBisane$ chmod +x Que_3.sh
~/DarshakBisane$ ./Que_3.sh
Enter value of n:
7
1 1 2 3 5 8 13
~/DarshakBisane$ ./Que_3.sh
Enter value of n:
55
1 1 2 3 5 8 13 21 34 55 89 144 233 377 610 987 1597 2584 4181 6765 10946 17711 28657 46368 75025 121393 196418 317811 514229 832040 1346269 2178309 3524578 570
2887 9227465 14930352 24157817 39088169 63245986 102334155 165588141 267914296 433494437 701488733 1134983170 1836311983 2971215073 4807526976 7778742049 12586
269025 2095941074 3295128699 5316291173 86267571272 139583862445 225851433717
~/DarshakBisane$ ./Que_3.sh
Enter value of n:
12
1 1 2 3 5 8 13 21 34 55 89 144
~/DarshakBisane$
```

4. Write a shell script which
will accept a number b and display first n prime numbers as output.

Output 4:

```
~/DarshakBisane$ nano que_4.sh
~/DarshakBisane$ chmod +x que_4.sh
~/DarshakBisane$ ./que_4.sh
Enter the value of n:
27
2 3 5 7 11 13 17 19 23 29 31 37 41 43 47 53 59
~/DarshakBisane$ ./que_4.sh
Enter the value of n:
21
2 3 5 7 11 13 17 19 23 29 31 37 41 43 47 53 59 61 67 71 73
~/DarshakBisane$
```

5. Write menu driven program for file handling activity

- Creation of file.
- Write content in the file.
- Upend file content.
- Delete file content

Output 5:

The screenshot shows a CoCalc terminal window with a menu-driven program for file handling. The program prompts the user to enter a choice from 1 to 4. The user enters '1', and the program prompts for a file name. The user enters 'Ajay', and the program confirms 'File created successfully'. The program then displays the menu again. The user enters '2', and the program prompts for content to write into the file. The user enters 'Ajay', and the program confirms 'Content written successfully'. The program then displays the menu again. The user enters '3', and the program prompts for the file name. The user enters 'Ajay', and the program confirms 'File content appended successfully'. The program then displays the menu again. The user enters '4', and the program prompts for the file name. The user enters 'Ajay', and the program confirms 'File content deleted successfully'. The program then displays the menu again.

```
~/DarshakBisane$ nano que_5.sh
~/DarshakBisane$ chmod +x que_5.sh
~/DarshakBisane$ ./que_5.sh
=====
FILE HANDLING MENU
=====
1. Create a file
2. Write content into file
3. Append file content
4. Delete file content
=====
Enter your choice:
1
Enter file name to create:
Ajay
File created successfully
~/DarshakBisane$ ./que_5.sh
=====
FILE HANDLING MENU
=====
1. Create a file
2. Write content into file
3. Append file content
4. Delete file content
=====
Enter your choice:
2
Enter content to write into file:
Ajay
Content written successfully
~/DarshakBisane$ ./que_5.sh
=====
FILE HANDLING MENU
=====
1. Create a file
2. Write content into file
3. Append file content
4. Delete file content
=====
Enter your choice:
3
Enter file name:
Ajay
File content appended successfully
~/DarshakBisane$ ./que_5.sh
=====
FILE HANDLING MENU
=====
1. Create a file
2. Write content into file
3. Append file content
4. Delete file content
=====
Enter your choice:
4
Enter file name:
Ajay
File content deleted successfully
~/DarshakBisane$ ./que_5.sh
=====
FILE HANDLING MENU
=====
1. Create a file
2. Write content into file
3. Append file content
4. Delete file content
=====
Enter your choice:
```

- ❖ **Conclusion:** In this practical, we conclude that shell scripting efficiently automates tasks like marksheet generation, system information display, number computations, and file management, enhancing system operations and user interaction through command-line utilities.

❖ **Discussion Questions:**

1. **What is the purpose of using shell scripting in this practical?**

Ans: Shell scripting in this practical automates tasks like marksheet generation, Fibonacci sequence calculation, system information display, and file management. It improves efficiency by reducing manual interventions and allows easy automation of routine tasks using simple commands and logic.

2. **Which command is used to display the current date and time?**

Ans: The date command is used to display the current date and time. It provides a formatted output, showing the system's current time, date, and related information depending on the user's locale settings.

3. **How does the script calculate the Fibonacci sequence?**

Ans: The Fibonacci sequence script uses a loop to iteratively calculate each number by summing the previous two numbers in the sequence, starting from 0 and 1. This continues until the specified number of terms is generated, making use of simple arithmetic operations.

4. **Which command is used to create a file in the file management script?**

Ans: The touch command is used to create an empty file or update the timestamp of an existing file. This is a simple and effective way to initiate a file before performing further operations like writing or appending content.

5. **How does the prime number script determine if a number is prime?**

Ans: The prime number script checks for divisibility by iterating through potential divisors up to the square root of the number. If no divisor other than 1 and the number itself is found, the number is classified as prime.
